identifying gene transcripts, involves generating first set of raw sequences by sequencing biological material, isolating first ditags and first tags, determining abundance of first tags, reducing sequencing

Disclosure; Fig 10; 104pp; English.

or the invention relates to a method of identifying gene transcripts. Which involves generating at least a first set of rew sequencis (is) by careful and the sequences (is) by such that the sequences is the capacity of the sequencing at least a first type of biological material, including the cabundance of T1 and identifying T1, and then reducing the amount of capacity of the provided to T1. The method is useful for the identification of gene capacity of the sequencing errors to be applied to T1. The method is useful for the identification of gene capacity of the sequencing control of the sequencing errors and the sequencing control of the sequencing errors are sequencing control of the sequencing error is capacity of the sequencing error is capacity at sequencing error is capacity as a sequencing error is capacity as each introduced by applying a statistical model. A measure of correctness of the sequencing error is capacity as each interest of the sequencing error is capacity as a statistical model. A measure of correctness of contentification through use of more than one database. The method provides the sequence reported by applying a statistical model. A measure of correctness of correctness of the sequence of the sequence is the sequence of the sequenc

                                                741, and (T) at a position corresponding to mucleotide 530. (I) can be used in gene therapy. (I) is useful for therapeutic purposes. A polypspide (II) encoded by (I) is useful for therapeutic purposes. A polypspide (II) encoded by (II) is useful in drug screening assays and in assays to measure the binding affinity of one or more candidate drugs targeting (II). An antibody (III) to (II) is useful to immunoprecipitate (III) from solution and also reacts with (II) on Western or immunologs of polybacrylands gels on embrane supports or substrates (III) is also useful in immunoassays to detect (II) in biological samples, AkP99057 to AkP99140 represent IGERA gene polymorphism detection primers, and AkP99141 to AkP99141 to AkP99140 represent IGERA gene polymorphism detection primers, and AkP99141 to AkP99140 represent IGERA gene polymorphism detection primers, and AkP99141 to AkP99140 represent IGERA gene polymorphism detection primers and AkP99141 to AkP99140 represent IGERA gene polymorphism detection primers which are used in
                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes an isolated polymucleotide (II comprising a nucleotide sequence (8) which is a polymorphic variant of a reference sequence for the human immunoglobulin R receptor I alpha subunit (IGERN) gene or its fragment. The polymorphic variant comprises at least one polymorphism scheeted from quantine (8) at polymorphics site (88) 1 R89, P810 or P821, adenine (8) at P82, P82 (9) at P82, P83, P84 (9) at P82, P84 (9) at P82, P84 (9) at P82, P84 (9) at P84 (9) a

RESULT 306
AAF98068
Communication sequence (S) which is a polymorphic variant of a reference—
Communication of the human immonglochulin E receptor 1 alpha subunit (GREA)
Communication of the human immonglochulin E receptor 1 alpha subunit (GREA)
Communication of the human subunit of the polymorphic site (PS) 1, PS9,
Communication selected from guantine (G) at polymorphic site (PS) 1, PS9,
Communication of PS21, cyrosine (C) at PS2, PS3, PS5, PS12, PS13 or PS22 and thymine (T)
Communication of PS21, cyrosine (G) at a position corresponding to mucleotide S20, (A) at a position corresponding to mucleotide S20, (A) at a position corresponding to mucleotide S20, (I) is useful for therapeutic purposes. A

Complypeptide (II) encoded by (I) is useful in drug screening seasys and communication of the polymorphism of the polymorphism of the polymorphism of mucleotide S20, (II) is useful for therapeutic purposes. A

Communication of the proper state of the proper

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ş
                                                                                                                                                                                                     Matches
          Human; Selectin L Lymphocyte Adhesion Molecule 1, SELL;
neonatal pertussis; whooping cough; haplotyping; primex;
allele-specific oligonuclectide; ss.
                                                Selectin L Lymphocyte Adhesion Molecule 1 (SELL) oligonucleotide #53.
                                                                                                                                                                                                                                                            polymorphisms (SNPs) identified therein. The sequences can be used to heplotype the 90% gene of an individual, and to establish whether FOR is a suitable target for daugs to treat cancer and disorders associated with impaired process synthesis in cells. The present sequence is an allele specific primer for the coding sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                 New genetic variants comprising haplotypes of the P450 (cytochrome) oxidoreductaes (POR) loggene, useful in improving the efficiency of drug screening protocols for compounds targeting POR -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       01-OCT-2001; 2001WO-US30877

```

The invention relates to an isolated polynucleotide (I) comprising a Claim 17; Page 14; 137pp; English. protein useful in identifying drugs to treat whooping cough

with iteration the reaction to all should polyhorize the degree of a reference conclusion and eaglement which is a polymorphic variant of a reference group and the state of t specific condition or disease predicted to be associated with SELL cattivity. The method is also useful in screening for compounds or targeting SELL to treat a specific condition or disease predicted to be associated with SELL activity, e.g. detecting which of the SELL cattivity, e.g. detecting which of the SELL cattivity, e.g. detecting which of the SELL cattivity for cath of the specific disease of interest enables one to screen to population with the specific disease of interest enables one to screen to compound that display the highest desired agonist or antagonist cattivity for each of the most frequent SELL isoforms present in the categories of the effect of the variation on the biological activity of SELL, on the conditions of the most of the categories to the treatment of the most permissis (whoping cough) and in assays to measure the categories the SELL activity of SELL for the treatment of the categories of the categories candidate drugs targeting SELL for the treatment of the categories and the specific activity of SELL for the treatment of the categories of the categories and the second that seems the categories are candidated drugs targeting the SELL categories and the second that the second the second that

The gene and mutation is found in the copy lyadenylation signal of di. The method is useful for identification of a disease caused by mutation or for their genetic predisposition where the disease is buman disease which is from Alzhainer's disease. For a three predictions are constituted a predictory multi-infarct dementia, framilial British dementia, primary X-linked mental retardation and where the funant disease constitutes a predisposition or a genetic variation, the pathological manifestation of which is riggered by medicaments or trues which is compared by canadose and the transport of the manifestation disease to transport and retardation comprises any torms of demential control of the manifestation disease to transport and retardation of the manifestation disease to transport and retardation of the manifestation disease to transport and the comparison of the manifestation disease to transport and the comparison of the provider of the provider of the confidence of the provider of the confidence of the provider of the confidence of the

New polypeptide, for raising antibodies that recognize hoDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser describion ionization, comprises human myosin-like protein hGDMLP-1 -

Disclosure; SBQ ID 2293; 214pp; English.

ce The present invention describes a human genome-destived myosin-like to protein 1 (RopMup-1). The protein and polymuchecitide sequences of the MoMAUP-1 can be used in gene therapy and varcine production. The ConfigMup-1 uncleic acids can be used as probes to detect, characterise and quantify highwap-1 nucleic acids in samples, as semplification contained to provide initial substrates for the recombinant septimering of highwap-1 protein variants having desired phencypic improvements, and core expressing the proteins. The highwap-1 protein or polymuches to raise antibodies that specifically recognise may be used as immungent to raise antibodies that specifically recognise concentration and/or sendands in assays used to determine the concentration and/or sendands in assays used to determine the protein concentration and herepetic supplement in particular by receiping a disorder specific supplement in particular septiment therefore the first protein and polymuchecities sequences encoding hombup-1 may be used for disposing a disorder associated with the expression of highler), in comparation and a sealered muscle disorders. hombup-1 is localized to chromosome 22. The present sequence represents an oligomer used in the excreming of the highler-1 sequence in the exemption of the present concentration.

1. B. The sequence data for this patent did not form part of the printed consideration.

              The present invention describes a human genome-derived myosin-like protein 1 (hoghup-1). The protein and polymucia-orde sequences of foRMLP-1 can be used in gene therapy and vaccine production. The hoghup-1 models acids can be used as probes to detect, characterise and quantity hoghup-1 models acids can be used as probes to detect, characterise and quantity hoghup-1 models acids in samples, as ambitisation in substrates for the recombinant engineering of hoghup-1 protein variants having desired phenotypic improvements, and
                                                                                                                                                                                                                                                                                        New polypeptide, for raising antibodies that recognize hgDMLP-1 proteins, or as specific biomolecule capture probes for surface enhanced laser description ionization, comprises human surface enhanced laser description ionization, comprises human

   given in the specification, a sequence containing at least 15 consecutive muchacides from the Ji mer sequence at the sequence with after organization muchacides from the Ji mer sequence with after sequence that hybridises so them under highly stringent conditions or the complement of all set than, or the corresponding RNA. The noutes call for detecting identifying quantifying and/or emplifying and primers for detecting detections of the invention complement of a general primer sequence of the invention complement of a general primer sequence of the production of the invention complement of a general primer sequence of the production of the complement of the general primer sequence of the production of complement of primer sequence of the production of the complement of primer sequence of the sequence of the sequence and control of the production of the invention can be used to generate a time of process of these controls of the sequences of the invention can be used in general theory. This polymorbettide sequences of the invention can be used in general theory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

The present sequence represents a preferred target sequence for an entymatic nucleic acid (i.e., a thompson which cleaves relat.)

making the nucleic acid (i.e., a thompson which cleaves relat.)

The real gene nucleic be sequented in the DE line.

The real gene nucleic be sequented in the DE line.

The real gene nucleic be sequented in the tenderion of inflamentary responses. Regions of the make that do not form secondary responses. Regions of the make that do not form secondary to diding structures and that contain potential hammentaed can hairpin kinonyme cleaves getter ever dentified by computer analysis. Altonymes cleaves stress were identified by computer analysis. Altonymes cleaves stress that these hair importances were contained and there have modifications that improve their regions sequenced and there have not transplanted on cleaves the contained and there have not the expension, making them potentially useful as for increasing polarance to transplanted contained and that as for increasing polarance to transplanted contained and the potential municiparizes to proporties of a riboyme cleaves real makes are limited to local that one can be altered and contained and the views of the potential makes are limited to local can be altered and can be altered and contained and conta

present invention

synovial membrane of joints foor the treatment or prevention of arthritis, particularly occentrated for the treatment of a trivitis. The RMN can also be used to treat antigen presenting cells of a donor to induce tolerance in a recipion to an alloantigen of a donor. They can also be used for treating graft tolerance or for treating autoimmune disease, and for treating alterjates and other inflammancery conditions. The RMN c can also be used in diagnosis, Ribozyme therapy impacts on the expression of to tromelysin which accompany treatment with retuncids and dexamethasons. The concentration of ribozyme required to affect a therapeatic treatment also present sequence is used in the remaining and is highly specific many present sequence is used in the semplification of the

The present invention describes a novel enzymatic nucleic acid (SRM) having a hammethead motif (RM) comprising; (i) at least 5 ribose residues; (ii) a 2"-C-ally! modification at position 4 of the SNM, (ii) at least ten 2"-O-methyl modification, and (iv) a 3"-end modification at least ten 2"-O-methyl modification, and (iv) a 3"-end modification. The ENN's can inhibit collageness and stromelysin production in the

Enzymatic nucleic acid molecules having a for the treatment of arthritis, induction treatment of auto-immune diseases

The present invention describes a novel enzymatic nucleic acid (ENNA) having a hammerhead motif (ENN) compating: (1) as Least 5 ribose.

Tesiduses; (ii) a 2"-c-allyl modification at position 4 of the ENNA) at least ten 2"-c-methyl modifications; and (iv) a 3"-end modification. The ENNA's can inhibit collagenase and stromelysin production in the synovial membrane of joints for the testaments prevention of atthicts, particularly ostewarthitis for the testaments prevention induce collectance in a recipient to an alloahige of a domor They can also be used for enhancing graft to herance or ion treating alteriors. The ENNA's can also the collectance of the 
                                                                                                                                                                                                                                                                                                                                                                                                                       Draper K, G

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
```

The present invention describes a novel enzymatic nucleic having a hammerhead motif (HM) comprising: (1) at least 5 residues; (11) a 2'-C-allyl modification at position 4 of at least ten 2'-O-methyl modifications; and (iv) a 3'-end

modification the ENA; (iii) ribose acid

(ENA)

Braymatic nucleic acid molecules having a hammer-head motif - used for the treatment of arthritis, induction of graft tolerance or treatment of auto-immune diseases

AW49008-236 represent antisense oligomucleotides directed against the rb gene. Of these, only oligomucleotides AW49008-52 resulted in effective downesquiation of negative growth control by rb, while oligomucleotides AW49052-236 had little effect. The oligomucleotides exemplify the invention. The specification describes oligomucleotides that contain 8-30 mucleotides, which contain at most 8 mucleotides that contain 8-30 mucleotides, which contain at most 8 mucleotides that can each form three phytrogen bonds to cytosine; do not contain four consecutive mucleotides able to form three H-bonds each to four consecutive of the consecutive mucleotides and the sequences of three consecutive mucleotides each able to form three H-bonds to three consecutive mucleotides each able to form three H-bonds to three consecutive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                particularly ossesour hattis or "Amematoid methalis" The SNA s can also be used to treat antigen pessenting calls of a dorse to induce clastrance in a recipient to an allowing pessenting calls of a dorse Taylore also be used for enhancing graft tolerance or for treating surclimans disease used for treating allegies and other inflammatory conditions. The SNA can also be used in disgraps a bloomyme therapy simparts on the expression of stromelysis without introducing the non-specific effect deprecable expression which accompany treatment with retinoids and department expression which accompany treatment with retinoids and department is lower than that required of antisenses solucines and shighly supposited. The present sequence is used in the exemplification of the

                                                                   AAX/0947-31915 represent tag sequences of transcripts that are cancer; or in both. The tag sequences can be used to identify comes by matching the tag to a gent data has emmbler, or by using the tag sequences as probes to isolate unidentified genes from 200MA libraries. The tag sequences can also be used in amethod for diagnosing colon or pancreatic cancer in a sample suspected of being neoplastic. The method comprises comparing the level of at least one transcript in a first sample of a tissue to a second sample, where the first sample is a colonic tissue suspected of being neoplastic and the second sample is a normal human colonic being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from AA30947-31015. The method conformation can be used in the

Triplex formation results in displacement of the reperson which is detected as an indication of the presence of the DNA test sequence. The method is used to detect DNA sequences, particularly for identification of bacteria (by detecting genes for ribosomal RNA) in clinical samples, but also detection of oncognes and Hepatitis B virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a potential triple-helix forming region. It can be used to demonst rate the assay of the invention. The assay comprises adding a sample containing double-stranded DNA test sequences, e.g. containing the present sequence, to an aqueue sequence and the containing at least one complex of anchor DNA, attached to a solid support, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Assay of genetic sequences based on triplex formation from double stranded analyte - and hybrid of enchor and reporter sequences, with reporter released if triplex formation occurs, used e.g. to identify

Or The present sequence represents an amplified fragment of the human content upon, derived from primer B (see ARZG0705). The encoded peptide contents the distmbhide systeine bond. The amplified fragment contents and used in the method of the invention. The specification describes a method for the mass production and culture of lactoferrin polypeptides from micro-organisms. The method uses plasmid vectors to reinstorm yeast cells that are resistant to lactoferrin polypeptides. Or contenting the production of the ambigocrarial peptides produced, the number of contentinating organisms is reduced whilst maintaining high polypeptide production rates. The micro-organism is content in the mass production of lactoferrin polypeptides. The micro-organism can also be used to produce other antiboceral poptides that are difficult to mass produce due to their shifty to slow down
                                                                                                                                                                                                                                                         Sequence 15 BP; 6 A; 1 C; 3 G; 5 T; 0 other;

The human prost gene sequence covariants 27 single muclectide polymorphisms (SNPs). AN80895 and CARRO895 or contains 27 single muclectide polymorphisms (SNPs). AN80895 and care used to isolated by AN87195. The invention includes PCR and sequencing primers, and probes represented in AN808989. AN81181 which could be a sequenced and characterise the PCRS2 gene sequence, and to colorate the positions of the SNPs. PTGS2 proteins and polymuclectide analysis or drug-binding studies and also in gene therapy (sieher compressing PTGS2 or inhibitory RNA). Antibodies raised against PTGS2 are used to repressing PTGS2 or inhibitory RNA). Antibodies raised against PTGS2 are useful for dagnosis, promosis and therapy and analysis of the new, and compressing PTGS2 or inhibitory RNA). Antibodies raised against PTGS2 are useful for dagnosis, promosis and therapy and particularly consciptions of the propose to determining association between a particular trait, e.g. and control proposition of the propose to determine pTGS2 and the particularly consciption of the propose to determine pTGS2 and the particularly consciption of the particularly consciption of the particularly consciption of the particular particular particularly consciption of the particular particularly consciption of the particular particularly consciption of the particular par
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches 13;

dystonia (Mp). This information would be useful for studying the control of DND2 as well as in identifying drugs targeting this protein for the treatment of disorders related to the Amnormal expression or function, Bolymorphisms in the DND2 gene affect the Congression of function, Bolymorphisms in the DND2 gene affect the Congression of active and functional polyagetides. Therefore it is a darkningages to detect polymorphisms in the DND2 gene and how those conjunctions are combined in different copies of the gene. AM70261 to AM70300 represent human DND2 allale specific conjunctional polyagetides. The protein the DND2 allale specific conjunctional primers which are used in the detection of DND2 allale specific conjunctions. AM70405 to AM70421 represent oligonucleotide primers for the detection of them DND2 polymorphisms which are given in the compilification of the present invention. AM70431 to AM70338 represent Congression of the present invention. AM70431 to AM70338 represent congression of the present invention. AM70431 to AM70338 represent congression in the compilification of the present invention. AM70431 to AM70338 represent congression in the compilification of the present invention. AM70431 to AM70338 represent congression in the compilification of the present invention. AM70431 to AM70338 represent congression in the congression in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polynuclectides comprising single nucleotide polymorphisms in the human dopamine receptor D2, useful for detecting mutations associated with, e.g. schizophrenia, Parkinson's and myoclonus dystonia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes polynucleotides comprising single nucleotide polynucleotide polynucleotide polynucleotide polynucleotides may be used in assays to detect and characterise polynucleotides may be used in assays to detect and characterise polynucleotides may be used in essays to detect and charactery and are polynucphisms in DRD2 that affect its expression and activity and are involved in disapreters such as schizophrenia, Parkinson's and mycolomus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2001-091967/10
                                                                                             present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 15; Page 23; 135pp; English.

of skin disorders. The method comprises contacting the skin with an antisense oligonucleotica (for Insulin-like Growth Ractor [IGR]) receptor IGF binding protein [IGFPP] 2 or IGFPS]), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide of the present invention (see AR4S151 and AR4S152-R45161). The method is useful for ameliorating the effects of psoriasis, following the structure of the service of the skin, alternative condition such as a neversecular condition of the skin, a typermovascular condition unch as a neversecular condition of the skin, a typermovascular condition such as a neversecular condition of the skin, a typermovascular condition such as a neversecular condition of the skin, a typermovascular condition such as a neversecular condition.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Common present invention relates to a method for ameliorating the effects of skin disorders. The method comprises connecting the skin with effects (cantisense obigonucleoride, (for insulin-like Growth Factor ([37]) (capable of cinhibiting or reducing growth factor ([38]), which is capable of cinhibiting or reducing growth factor mediated call proliferation, considered and or other disorders. The present sequence is an collisionation and/or other disorders. The present sequence is an collisional capable of the second transfer of the antisense (and the second transfer of the second transfer o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                      Ampliorating the effects of a disorder, e.g. psoriasis, by administering Ut (litra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antisense therapy, antiproliferative, antinflammatory, antipositic, cycostatic, demandological, cardiant; vincide, ophthalmological, kelod, skin disorder; Insulin-like Growth Factor 1 xeceptor; IGP-1, pityrizali; IGP binding procein, IGEP-2, IGEB3; inflammation; poortasis, pitaris, growth factor mediated cell proliferation; ichthyosis, schoorthoa; ruba; kerabosis nepplasis, scherodema; watt, skin cancer; sclerotic disease; yperimeovascular; condition; luperplasia; kidney disease; yperimeovascular; condition; luperplasia; kidney disease;

                                                                                          Collection of phagemids, useful for phage display of includes a promoter induced by expression of gene IV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      receptor, IGP binding protein [IGRB9]-2 or IGRB93], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligomucleotide which can be used to design the antisense oligomucleotide of the present invention (see APF4513 and APF4513-745161). The method is useful for ameliorating the effects of marchiasia, inhibitoria with instance and appears to the contraction of the province of the present invention (see APF4513 and the effects of the present invention (see APF4513 and the effects of the present invention (see APF4513 and the effects of the present invention (see APF4513 and the effects of the present invention (see APF4513 and the effects of the present invention (see APF4513 and the effects of the present invention (see APF4513 and the effects of the present invention (see APF4513 and the effects of the present invention (see APF4513 and the effects of the present invention (see APF4513 and the effects of the present invention (see APF4513 and the effects of the present invention (see APF4513 and the effects of the present invention (see APF4513 and the effects of the present invention (see APF4513 and the effects of the present invention (see APF4513 and the effects of the present invention (see APF4513 and the effects of the present invention (see APF4513 and the effects of the present invention (see APF4513 and the effects of the present invention).

The invention relates to a collection of phagemids that comprise (i) the promoter of the Escherichia coll phage-shock protein (psp) operon linked to a gene encoding a fusion between a peptide and a filamentous, single-strand DNA phage coat protein, or its fragment, (ii) origin of replication (or) from the specified phage and (iii) plasmid origin of replication. The psp promoter is induced by expression of gene IV of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Phagemid; ds; phage-shock protein promoter; psp; PI2; mutant; plant; filamentous phage gene IV; phage display; potato protease inhibitor.
                                                                                                                                                                                                                                                                                                                Disclosure;

                                                                                                                       filamentous phage. Also included is a collection of B. coli clones or cells that represent the phagemids, where the phagemids are in plasmid form. The phagemids are useful for phage display to identify peptide variants having a particular binding specificatry, especially modified plant protease inhibitors (e.g. poctac protease inhibitors (P2) that bind strongly to gut proteases in insects. The specified promoter provides satisfactory control over the fusion gene, and alminates the need for delicate washing (to remove glucose) required for switching on the conventional promoter, particulatly useful for large scale production of phage libraries in fermenters and in automated display processes.
Sequence 15 BP; 3 A; 6 C; 3 G; 3 T; 0 other;
                                                              e present sequence is a DNA encoding a representative mutant domain 2 potato PI2 as expressed by the phagemid library.

diagnostic markers for cancer, also derived probes New human nucleic acid containing specific SAGE tags, useful

Disclosure; Column 13; 161pp; English

10 ARX31901
11 ABXX11901
12 ABXX1201
12 AB that has the same sequence as a mRNA found in humans and is a SRE (serial analysis of gone expression) tag comprising a single stranded probe containing at least 10 consecutive mucleotides SASE tags and diagnostic and proposetic markers of cancer sepochally of the colon and pancreas. AEXI-1907.AEXI-1770 represent human colon and pancreatic cancer The invention relates to an isolated, purified human nucleic acid (I)

SAGE tags of the invention.

treating cancer, inflammatory disorders and autoimmune diseases -Novel enzymatic nucleic acid molecules which down regulates expression a sequence encoding a subunit of nuclear factor kappa B useful for

Claim 3; Page 63; 72pp; English

kappa B (hyps) where ()) is expensed an account of mountain the mountain of mountain continuation (mine apparent and interpretation (mine apparent) and an interpretation (mine apparent) and apparent (mine apparent) apparent (mine appar The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor enzymatic nucleic acid molecule.

WPI; 1998-400910/35

Preparation of antisense oligo:nucleoride(s) which lack long runs consecutive guanosine or inceine and have specific ratio or residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapeutically or to modulate growth of cells in culture of fr

Example 7; Fig 9c; 286pp; English.

AAV49008-236 represent antisense oligonucleotides directed against the rb gene. Of these, only oligonucleotides AAV49008-52 resulted in effective downersulation of negative growthes proceed by rb, while oligonucleotides AAV49032-236 had little effect. The oligonucleotides

                                    This oligonucleotide primer, termed ZC19676, was used in a method of the invention. The invention relates to zins (see ANYS570), a novel member of the invulin/relaxin family whose gene maps to a region of chromosome I that correlates with a heritable form of morinsulin dependent diabetes mellitus (NIDDM). The invention provides methods for identifying abnormalities in expression of provides methods for identifying abnormalities in expression of zins jabat are a factor in causing or predisposing, a person to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying mutations in human chromosome 1931, preferably a zina3 gene
mutation, comprises using an insulin/relaxin family member (designated
zina3), useful for diagnosing non-insulin dependent diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      2ins3; insulin; relaxin; human; NIDDM; diagnosis;

                                                                                                     This invention describes novel oligonucleoride primers or peptide nucleic acid (PNN) oligoners for detecting single nucleicide polymorphisms (SNP) and cytosire methylation status in chemically pretreated genomic DNN. The oligonucleorides are used for disponests and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligoners are also used for detecting cell type differentiation. ABIO0010-ABIO973 represent the oligoners described in the invention. MOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fip wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CBI protein). The present sequence is Rickettsia prowazekii NNA encoding beta-globin protein, a virulence factor protein. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                      Claim 1; SEQ ID 7955; 29pp + Sequence Listing; German

The oligonucleotides are used for diagnosts and/or prognosts of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligoners are also used for describer cell type differentiation.

                                            Novel generic variants of matrix metalloproteinase 13 (collagenase 3) gene useful in studying expression and function of the protein, and for screening drugs to treat diseases e.g. cancer and arthritis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               and pyrosine merbylation status in chemically pretrasted genomic DNA. The oligonucleotides are used for disposals and/or prognosis of cancer and a range of diseases including immune system, gentrolinestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligoners are also used for detecting cell type differentiation. ARCOOLIO-RESPOSA,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides the cDNA, protein and gene fragments of the human matrix metalloproteinase 13 (Collagenase 3) (Mug13) Also provided are single nucleotide polymorphisms (SNPs) identified within the sequences. The sequences can be used to haplotype an individual and in the treatment of cancer and architits, including metastatic cancers. The present sequence is a PCS primer for the MP13 gene, which is found on chromosome 11(22.3.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  06-APR-2001; 2001WO-IB00713

mis invention describes novel oligonucleotide primars or peptide nuclei acid (BNA) oligoners for detecting single nucleotide polymorphisms (SNN) and cytosine methylation status in chamically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including simmune system, gentroinestical, respiratory, or an experiment of the contract and methylation of the prince of the contract and methylation. The contract also used far detection and methylation of the prince of ignorers are also used far detection. Belloopy differentiation.

The oligonucleotides are used for dispansis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligoners are also used for detecting cell type differentiation. range of diseases including immune system, gustrointestinal, respiritory, central nervous system, cardiovascular and metabolic disporters. The oligometra are also used for describing cell type differentiation.

Authorito-Authoritory appresent the oligometra described in the invention. MRIGOTO-Authoritory appresent the oligometra described in the invention. MOTE: The sequence date for this pecent did not form part of the printed specification, but was obtained in electronic format from witpo at specification, but was obtained in electronic format from witpo at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes novel oligonucleotide primers or peptide nucleic acid (PNN) oligomers for detecting single nucleotide polymorphisms (SNP) and cyrosine methylation status in chemically pretracted genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a

The oligonucleotiaes are used for diagnosis and/or cytoposis of cancer and a range of diseases including immune system, gastroquestinal, respiratory, central nervous system for describing and gasholic disorders. The particular of the contral co
This invention describes novel oligonuclectide primers or pagaide nucleic acid (PMM) oligomers for detecting single nucleotide polymorphisms (SNP) and cyrosine methylation status in chemically pretreated genomic DNA. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Olek A,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     07-APR-2000; 2000DE-1019173

                                                                                                                                                                                                This invention describes novel oligonucleotide primers or peptide nucleic acid (PMA) oligoners for detecting single nucleotide polymorphisms (SMP) and cytosaine methylation status in chemically pretreated genomic DMA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a
                                                                                                                                                                                                                                                                                                Claim 1; SEQ ID 25693; 29pp + Sequence Listing; German
